Medicalistix LLC Announces Availability of Integration Between its eZportl® Product and NextGen EHR®

Dallas, TX — Medicalistix LLC, a leading provider of innovative, cloud-based healthcare information technology (HIT) solutions, has announced that comprehensive integration between their eZportl® product and their EHR content for Public Health and Corrections, based on NextGen EHR, is now available for General Release.

"This critical integration allows our clients to not only eliminate paper requests, but to close the loop and have complete accountability for healthcare and other types of requests submitted by patients," said Gary Steiner, EVP and chief technology officer, Medicalistix LLC. "The ongoing nursing shortage in Public Health and Custody environments is only getting worse, and we are proud to offer solutions that empower our clients to accomplish higher quality of care with fewer FTEs."

Healthcare providers in Custody environments, where the nursing shortage is most acute, leveraging Medicalistix revolutionary eZportl® product are saving the equivalent of twelve to twenty-four nurses, depending on their size, which allows them to devote that time to increased quality of care. They also achieve better retention rates by removing the mundane and risky job of collecting and processing all the various types of paper requests that are still used in their facilities.
